Sewerman Plunger

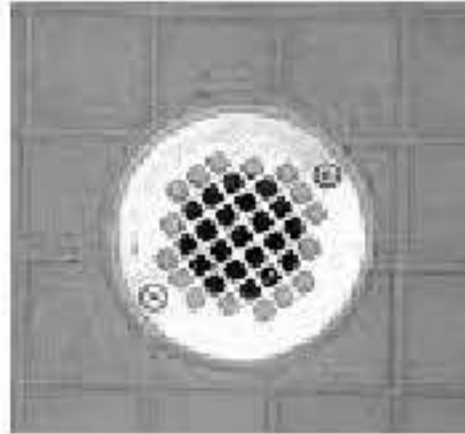

Always use caution using any tool. Please adhere to all OSHA safety guidelines.

Got a Problem Clog?

We may just have a solution for that!

Problem: Shower Won't Drain

Solution: Place your Sewerman Plunger over the drain & plunge until it opens. If you can't get a good seal over the drain, use the "dishtowel donut".

Problem: Floor Drain Clogged

Solution: Check the drain to verify that it's not backed up. Do this by running water somewhere else on the same line. If the water comes up, call a sewer & drain professional. If it's just the floor drain that's clogged, place your Sewerman Plunger over the drain & plunge until open. Use the "towel donut" trick for a good seal.

Problem: Tub Won't Drain

Solution: Remove the overflow cover. Place a wet rag in the opening. Plunge the drain with your Sewerman Plunger until open.

Problem: Bathroom Sink Won't Drain

Solution: Remove the stopper if it can be removed. If not, ensure that it remains open. Plug the overflow opening with a wet rag. Plunge drain with Sewerman Plunger until open.

Problem: Can't Get a Good Seal?

Solution: Form a wet dish towel into a "donut" & place between Plunger and surface area (drain, toilet, disposal, etc.) Plunge until open. Remove towel after plunging.

Problem: Clogged Toilet

Solution: Plunge toilet with your Sewerman Plunger until it's unclogged. If still stopped up, give it 1-2 hours (with water standing on it) & try again.

Problem: Clogged Disposal

Solution: Unplug the disposal. Place a finger between disposal drain & Sewerman Plunger. Depress your Sewerman Plunger & remove finger. Draw the Sewerman Plunger handle upward. Repeat as needed.

Problem: One Side of the Kitchen Sink Won't Drain

Solution: Place your Sewerman Plunger over the drain. Lightly make attempt to depress the Sewerman Plunger. If there's a lot of back pressure or resistance, then use the "one finger trick" and draw back until you feel some release.

If these tips are unsuccessful, call your local sewer & drain technician.
